#### **Document History**

Version	Date (DD/MM/YYYY)	Created/Amended by	Changes
0.1	15/03/2023	UNIBO	FIRST DRAFT
0.2	04/04/2023	UNIBO	REVISED DRAFT BY COORDINATOR TEAM
0.3	18/04/2023	UNIBO	FINAL VERSION

#### **Scheduled Data Management Plan (DMP) Updates**

The DMP is a document that evolves during the lifespan of the project and registers all relevant changes in the life cycle of all the research data sets. Updated versions of the DMP have already been planned (see table below). Moreover, this document will be updated whenever important changes in the data or the data management policy occur.

Issue	Expected by project month (M)		
Initial DMP	M6		
Intermediate DMP	M36		
Final DMP	M48

The Data Management Plan (DMP)4
1. Data Summary
<b>2.1 Making data findable, including provisions for metadata</b> 9
2.2 Making data openly accessible11
2.3 Making data interoperable14
2.4 Increase data re-use16
3. Other research outputs
5. Data security
6. Ethics
8. Data set overview
Annex I: Data sets tables
WP1 – Designing and Implementing Innovative and Sustainable Farming Systems
WP2 – Full Biomass Valorisation with a Circular Economy Approach
WP3 - Integrated Sustainability Assessment of the new Bio-Based Carina Systems49
WP4 – Co-creation of policy interventions for feedstock provision and certification in carina bio-based value chains
WP5 – Social Innovation to Scale-Up Carina Solutions for Bio-Based Agricultural Production Systems
WP6 – Dissemination, Communication and Exploitation
WP7 – Coordination & Management

## The Data Management Plan (DMP)

Data Management (WP 7, Task 7.5. Leader: UNIBO. Participants: All. M 1-48). A DMP will be established to support the data management life cycle for all data which will be collected, processed, or generated by the project.

The DMP will provide the identification elements and the descriptions of the data sets, and it will include details regarding how the research all the research data collected and generated within the "CARINA" project and how they will be preserved after it is completed. It explains the way research data are handled, organized, licensed, and made openly available to the public, and how they will be preserved after the project is completed. It will specify which methodologies and standards will be used in the data creation and management and how and when the data will be shared and made open for re-use.

The DMP will be a dynamic document in which all partners will actively participate throughout all the project duration. The current DMP represents the first 6 months of the project (D7.2) and updated and more detailed DMP versions will be delivered when necessary. The DMP also provides motivations when versions or parts of the project research data cannot be openly shared on account of third-party copyright issues, confidentiality, or personal data protection requirements or when open dissemination could jeopardize the project achievements.

The initial DMP will be composed in M6 (UNIBO, WP7) explaining in detail how the data generated in the project will be collected, processed, shared, and made accessible by project partners. The DMP will be updated timely (M36) with changes in the consortium policies (e.g., new innovation potential, decision to file for a patent, new consortium members joining or old members leaving). A final DMP will be submitted in M48. The data will be deposited in a trusted repository within the deadlines set out on this DMP. This DMP reflects the current state of the art of the "CARINA" project. However, the details and the final number of the project data sets may vary during the research. The variations will be recorded in updated versions of the DMP.

## 1. Data Summary

CARINA is an innovation action project to help foster the European bioeconomy at local level, unlocking the full potential and benefits of the circular economy in term of farm and industry competitiveness, and healthy soil and water. The results of CARINA will contribute to each of the expected outcomes of the topic "HORIZON-CL6-2022-CIRCBIO-01-04". The CARINA project will achieve its ultimate objective through the following specific objectives:

- to design and implement new site-specific primary production systems on farm-scale. The new systems will be thoroughly analysed within the lighthouses to co-create and develop innovative and sustainable technical solutions (**WP1**).
- to valorise the co-products of carinata and camelina through the extraction of molecules having different applications in the field of bioplastics, biochemicals, animal nutrition, biofuels, biostimulants and/or biopesticides (WP2).
- to carry out an integrated sustainability assessment of CARINA bio-based production systems, including the identification of sustainability indicators for the assessment of the economic, social, and environmental impacts (WP3).
- to co-create a set of policy recommendations that can maximise economic, environmental, and social synergies in the provision of certified low iLUC feedstock for bio-based value chains (WP4).
- To improve understanding of the co-benefits and potential risks, and to deliver solutions for upscaling potential bio-based agricultural production systems through a social innovation process. To achieve this objective, CARINA will establish national living labs (LLs) and organise 'co-define challenge' workshops within technical field visits, with the aim to co-create solutions from lessons learned, and to implement them locally to deliver tailored roadmaps and business plans (**WP5**).
- To ensure wide visibility of CARINA by setting up an effective communication dissemination strategy and, at the same time, pave the way for the exploitation of CARINA results. CARINA will achieve this objective posing attention to cluster and create synergies with other EU initiatives with strong links with CARINA (**WP6**).
- To coordinate and supervise the project activities, ensuring quality and timing of project deliverables; (2) to carry out administrative and financial management, and reporting;

(3) to manage contacts with the EU Commission (EC); (4) to resolve possible conflicts;
 (5) to oversee the knowledge and innovation management activities; (6) to manage the data generated by the project (Data Management Plan – DMP, WP7).

In CARINA, the research data and output generated in the project will be managed responsibly, in line with the **FAIR** (Findable, Accessible, Interoperable, Reusable) principles. Data will be collected, processed, shared and made accessible by project partners. The IPR policy (i.e., IP, confidentiality, and publication provisions) will be considered as defined in the Consortium Agreement. The data will be deposited in a trusted repository within the deadlines set out on the current DMP.

All formats of digital files stand the risk of becoming obsolete in the future. As a general guideline, CARINA considers that the file formats best suited for long-term preservation and accessibility:

- are commonly used;
- have open specifications;
- are independent of specific software, developers, or suppliers.

Research teams have agreed to convert research data from proprietary formats to well-known and documented open formats to facilitate accessibility and reusability (Tab.1). CARINA will produce different types of data by using different methodologies. Research teams have agreed to convert research data from proprietary formats to well-known and documented open formats in order to facilitate accessibility and reusability (Table 1).

#### Table 1 - Summary of data formats

Type of data	Formats used during data processing	Formats for sharing, reuse and preservation
Numerical, quantitative, and graphical data (Data will be processed statistically)	Microsoft Excel (.xls/.xlsx) Comma Separated Values (.csv) Data collection/generation (raw data) in Excel format. Data processing in Phenome networks	Comma-separated values (.csv) MS Excel (.xls, .xlsx, .csv) PDF/A (.pdf) OOXML (.docx, .doc)
Statistical data	STATA format (.dta)	Comma-separated values (.csv) STATA format (.dta) MS Excel (.xls, .csv)
Quantitative	Raw data, MS Excel (.xls/.xlsx)	Comma-separated values(.csv) MS Excel (.xls, .xlsx, .csv)
Qualitative	Microsoft Word (.doc/.docx) Portable Document Format (.pdf) Raw data	Rich Tech File (.rtf) Non-Unicode TXT (.txt) OpenDocument Text (.odt) PDF/A (.pdf). Data processed, aggregated, and evaluated by using qualitative data analysis software NVivo.
Qualitative and quantitative experimental data (in vivo and in vitro) Simulation data Numerical, textual, tabular, digitized, primary, secondary, and raw data (spreadsheets)	MS Word (.doc/.docx) MS Excel (.xls/.xlsx) JPEG (.jpeg, .jpg)	<ul> <li>(.xlsx) format converted into (.csv) before sharing.</li> <li>SPSS Portable format (.por)</li> <li>Textual data will be collected and processed in (.doc) format and converted into (.txt).</li> <li>Digital images will be converted in (.tiff)</li> </ul>
Numerical, born digital, quantitative, and raw data	Excel File MS Excel Word file MS Word PDF Adobe Portable Doc Format	(.xls/.xlsx, .csv), (.doc/.docx), (.pdf)
Numerical, textual, graphical, visual, or tactile, raw data, secondary, derived, cleaned, processed	Data collection/generation (Raw data); data processing	MS Excel (.xls/.xlsx, .csv) data processing, MS Word (.doc/.docx, .rtf); data preservation and sharing: PDF (.pdf), readme files (es.txt, .doc)
Numerical, graphical, visual, digital images	JPEG (.jpg, .jpeg) TIFF (.tiff, .tiff) PNG (.png)	JPEG (.jpg, .jpeg) TIFF (.tiff, .tiff - uncompressed)
Audio data	mp3 format (.mp3)	mp3 format (.mp3) Interview audio records are transcribed and, where necessary, anonymized.
Qualitative and quantitative experimental data (in vivo and in vitro) Simulation data	MS Excel (.xls/.xlsx) data processing: MS Excel (.xls/.xlsx), MS Word (.doc/.docx) and MS PowerPoint (.ppt/.pptx) data	PDF (.pdf)

Documentation files explaining all relevant details regarding data collection, processing methodologies and quality assurance are deposited along with the data sets in .odt, .rtf or .pdf format. The existing data reused during the project are from several sources (i.e., scientific literature, etc.).

The data produced can be of interest to different potential users inside and outside the project. Basically, they include:

- oil crop producers, agronomists, farmers, farmers cooperatives and unions, scientific community working on oilseed crops, scientific community working on pest management, researchers, students, policy makers, stakeholders;
- biobased industry who will get to know how the feedstocks used in their processes related to benefits and potential risks for the environment.
- EU policy makers, interested in understanding the best way to diversify primary production whilst promoting and sustaining biodiversity.

Furthermore, abstracted and summarized data will be interesting to "prosumers" and the public interested in camelina and carinata breeding and composition. Hence, CARINA also strives to collect the data that has been disseminated and potentially advertise it. The data could also be used as a source for topic-related studies, comparisons and for different analyses, for example for simulating and exploring the scenario that follows alternative specific communication policies.

Considering the early stage of the project, the expected size of the data is still uncertain, but it is estimated that it may not exceed 500 GB - 1 TERA. If data produced will be excessive, it will be possible to incur in extra costs not currently foreseeable. The effective size may vary with respect to what is declared in the present document. Potential variations will be addressed in further versions of this document.

#### 2. FAIR Data

This DMP follows the EU guidelines1 and describes the data management procedures according to the FAIR principles<sup>2</sup>. The acronym FAIR identifies the main features that the project research data must have in order be findable, accessible, interoperable, and re-useable, allowing thus for maximum knowledge circulation and return of investment. In CARINA, the research data and output generated in the project will be managed responsibly, in line with the FAIR (Findable, Accessible, Interoperable, Reusable) principles and by taking all actions established in Article 17 of the Annotated Model Grant Agreement.

<sup>&</sup>lt;sup>2</sup> The FAIR data principles (GO FAIR), <u>https://www.go-fair.org/fair-principles/</u>

# 2.1 Making data findable, including provisions for metadata

To improve findability of research data produced during CARINA project, datasets will be deposited in trusted<sup>3</sup> data repositories.

During the project and at least at the moment of publication of project results, each research team will deposit and describe the relative underlying data sets. Trusted data repositories can attribute persistent unique identifiers (PIDs) to the deposited items. Partners are strongly recommended to use the persistent unique identifiers (DOI, Handle, etc) to cite the datasets as underlying data within their research publications.

The repositories identified by the consortium are summarized in Table 2. Moreover, the chosen data repositories support standard descriptive metadata to ensure data sets indexing and discoverability.

At the moment of publication of project results, each research teams will deposit and describe the relative underlying data sets in institutional or public data repositories that can attribute persistent unique identifiers to the deposited items. Partners are strongly recommended to use the persistent unique identifiers (such as DOI or Handle etc) to cite the data sets as underlying data within their research publications. The chosen data repositories support standard descriptive metadata to ensure data sets indexing and discoverability. They all support **Dublin Core and DataCite Metadata Schema**. Moreover, they comply with the OpenAIRE 3.0 requirements for data archives. Consequently, the project data sets will be visible via the OpenAIRE portal, facilitating project reporting procedures.

The metadata standard in the repository consists of the following information: Title, Author, Contact person, Description, Subject area, Key words, Associated publication, Grant information, Author Identifier (e.g., ORCID, if applicable). Such metadata will facilitate access to the data. Specific keywords derived, when possible, from thesauri and controlled vocabularies will be associated to each data set to enhance semantic discoverability.

<sup>&</sup>lt;sup>3</sup> Search your field repository in <u>https://www.re3data.org/</u>

CARINA research data are organized in data sets, which are named collections of data units with the same focus and scope. In this DMP are suggested the following common rules for data set naming in order to improve data visibility, discoverability, citation and permanent online tracking.

The recommended data set title structure consists of:

PROJECT ACRONYM. WPnumber. WP title or description specifying WP aims. Tasknumber. Task title or description specifying Task aims. additional information specifying coverage and nature of data (if necessary). version number (optional, in case of revisions to help identifying the updates especially in repositories that do not track versioning automatically)

Example:

#### CARINA. WP7. Task7.5 Data Management Plan (DMP). v0.2

The version number of the data set will be added at the end of the title in case of data revisions to help identifying the data set updates especially in repositories that do not track versioning automatically (see *Annex I* for data set names, unique identifiers and descriptions).

The DMP recommends also the following rules for file naming:

• for data set file(s):

[PROJECT ACRONYM] WPnumber\_Tnumber\_coverage or other content specifications\_date (YYYYMMDD)\_vn.file extension

Example:

CARINA\_WP2\_Task 2-1\_oil-valorisation\_20200828\_v03.csv

• for readme file(s)<sup>4</sup> :

[PROJECT ACRONYM] \_WPnumber\_Tnumber\_coverage or other content specifications\_date (YYYYMMDD)\_vn\_README.file extension

Example:

CARINA\_WP2\_T2-1\_oil-valorisation\_20200828\_v03\_README.rtf

*WPnumber* means "work package number"; *Tnumber* is "task number", and *vn* is the "version number" (in case of data revisions or updates).

<sup>&</sup>lt;sup>4</sup> A "README" file is a document containing relevant information about data set authorship, terms of reuse and responsibilities, explaining data set content and structure, collection procedures and analysis (such as file specifics, methodologies, codebooks of variables, data sources, and further necessary notes). (See Annex III to visualize the suggested README file template).

### 2.2 Making data openly accessible

As a guiding principle, CARINA seeks to ensure open access to research data, via the repository, as soon as possible and within the limits and deadlines set out in the DMP, in order to allow dissemination, validation and re-use of research results. To this purpose, all the files will be converted to standard and well-documented open formats and the data sets will be deposited with all relevant documentation and explanation.

The data repositories chosen by partners are both institutional, disciplinary and general repositories. They guarantee long term preservation and attribute persistent unique identifiers to the archived data sets (such as DOI or Handle). They support open licenses and different access levels. Finally, they adopt descriptive metadata standards as required by the OpenAIRE Guidelines and allow cross-linking between publications and the relevant data sets.

Moreover, they comply with the OpenAIRE 4.0 requirements for data archives. Data deposition in repositories will guarantee long time preservation and accessibility to datasets. Consequently, the project data sets will be visible via the OpenAIRE portal, facilitating project reporting procedures. Data deposition in repositories will guarantee long time preservation and accessibility to datasets.

Restrictions to access are applied only in the following cases:

- when collected data belongs to third party which have denied permission for sharing them;
- on account of confidentiality and proprietary issues;
- protection of personal data of subjects involved in the research.
- when availability of the data would mean that the project's main aim might not be achieved.

Consequently, all possible and legitimate actions and strategies are adopted to allow data sharing including:

- obtaining copyright permissions from third party data owners to be allowed to re-use, reproduce and distribute the collected data;
- converting the files to standard open formats;
- providing all relevant documentation and explanation for the data and the data sets;
- obtaining the consent of stakeholders involved in focus groups and anonymizing and aggregating the data of interviews;
- in case of copyright on raw data derived, collected, or elaborated from pre-existing databases or from other original sources (i.e., papers, journal articles, book chapters, reports, video, and audio sources), collected data will be made available if the reproduction

and sharing are allowed by expressed permission of the right holders or by applicable copyright exceptions and exemptions. Specifically, reproductions and communication of brief excerpts of texts and of other protected works are permitted for illustration purposes for scientific research, provided that the source, including the author's name, is acknowledged and provided that the use does not conflict with the exploitation of the original source and does not unreasonably prejudice the legitimate interests of right holders. Otherwise, only aggregate data resulting from the analysis will be openly published. Anyway, when the sources are freely available on-line in their original repositories, but direct reproduction is not allowed, a detailed account on how the data set was created from the original data will be provided, together with the specification of open repositories from where the original data sets are available. Raw data consisting in full texts will not be made available without copyright holders' permission.

For data that fall under some of the restrictions described above and for which it is not possible to take any action to make them shareable, EU allows complete closure or restricted access to them. CARINA DMP indicates the versions or parts of the data sets that cannot be freely shared providing the specific motivations in *Annex I*. At the time of publication of results, researchers deposit the project data that can be shared in a data repository in order to guarantee their discoverability, access and preservation beyond the project end. Each different data set is deposited by the team that is responsible for the data collection and management in the repository of their choice.

 Table 2 – Summary of repositories. The following table shows the repositories for data sets publication

 and preservation chosen by CARINA partners.

Partner	Repository name	Туре	URL		OpenAIRE compliant?
UNIBO	Zenodo	Multi- disciplinary	https://zenodo.org/	DOI	YES

FCAC	NYA	NYA	NYA	NYA	NYA

For each deposited data set, all relevant documentation explaining data collection procedures and analysis (such as codebooks, methodologies, etc.) will be made available along with the data to guarantee intelligibility, reproducibility and the validation of the project findings. Moreover, the deposited documentation specifies the tools and software recommended to reproduce and reuse the data, when necessary. (See Tab.3 for examples of tools and software enabling reuse of the dataset). Open-data repository for long-term preservation data, such as ZENODO, will be used for open dissemination and preservation of research data by all research teams that do not have suitable institutional, national, or disciplinary data repositories.

#### 2.3 Making data interoperable

All data sets will be described using standard descriptive metadata such as Dublin Core and DataCite Metadata Schema in order to ensure metadata interoperability for indexing and discoverability. All relevant documentation explaining codebooks, users' manuals, data collection procedures and analysis will be made available along with the data in order to guarantee intelligibility, reproducibility and the validation of the project findings.

To allow data exchange and re-use among researchers, institutions, organisations, countries, etc., partners will convert all shareable data from proprietary formats and will made them available in well-known and documented open formats (see Table 1 for details), as much as possible compliant with available (open) software applications.

In particular case<sup>6</sup>, software is used in data processing, full explanation and instructions will be included in the deposited documentation (a summary of the tools and software necessary to reuse

<sup>&</sup>lt;sup>6</sup> SYSTERRE® (ARVALIS) is a tool used to describe practices and calculate a set of indicators designed to assess the technical, economic and environmental performance of cropping systems. Based on the description of agricultural practices and strategy, SYSTERRE calculates and generates a set of indicators to assess the technical, economic and environmental performance of productions and then, to build innovative alternatives in terms of sustainability. SYSTERRE® uses scientifically recognized standardized methods to calculate a panel of 20 indicators. These indicators can be classified in 3 categories: technical indicators such as working time and number of tool passes, fuel consumption, etc., economic indicators such as economic efficiency of inputs, mechanization costs,

of data sets is described in Table 3). Sometimes, the fact sheets will be created based on available recent literature selected by a key-word search in web of science as well as relevant policy documents.

Tools/software
Open spreadsheet and document editors, such as OpenOffice <sup>7</sup> or LibreOffice
free CSV file viewers, such as CSV viewer <sup>8</sup>
MS Excel (.xls/.xlsx .csv)
Excel and MATLAB to manage and perform statistics
SYSTERRE® (online tool to describe diversified cropping systems, to calculate their
performances, and assess their sustainability)
PESTEL data base, SWOT/TOWS matrix analysis
CAQDAS, NVivo, Alfasoft
Life cycle assessment Cost benefit Focus group Delphi consultation
Chromatographic analysis
Survey123 & RnDexp
SOP for experimental designs and data collection.

Data produced are related to:

- Field trials, laboratory analyses, living labs activities, biopesticide (bioherbicides and bioinsecticides) tests; biostimulator germination tests, biochemical analyses, soil analyses, <u>(WP1&WP2);</u>
- WP3 outputs, WP1 co-design workshops, WP4 and WP5 for living labs and policy innovation labs;
- WP2 demo trials, WP3 multi criteria assessment, WP4 and WP5 for living labs and policy innovation labs;
- D6.1 Dissemination, communication and exploitation plan, 1st version;
- Data collected in WP5 data (Task 5.3) can be used for WP3 and WP4 and WP5 (task 5.4);
- Results will be used directly in 3.1.2 for bottom-up review.

will be referenced within the dataset.

<sup>&</sup>lt;sup>7</sup> OpenOffice: <u>http://www.openoffice.org/</u> <u>8 https://csviewer.com/</u>

margins, production costs, etc., and input use and environmental indicators such as overall nitrogen balance and mineral balance, TFI (treatment frequency index), energy production and consumption, greenhouse gas emissions, etc. This strategic decision support tool can be used for farm advisory services, student training, as well as experimenting with cropping systems.

#### 2.4 Increase data re-use

CARINA distributes the shareable data by adopting licenses that allow re-use of the data and of the data sets in their entirety by other scholars and stakeholders. The data sets will be made available under CC BY licenses, a Public Domain Dedication (CC 0) Creative Commons Attribution 4.0 International (CC BY 4.0<sup>4</sup>) license or equivalent. The CC BY 4.0 license permits users to freely share, modify, and use the data, subject only to full credit to the author(s).

As an exception, if the access would be against the beneficiaries' legitimate interests, the beneficiaries must grant nonexclusive licenses — under fair and reasonable conditions — to legal entities that need the research output to address the public emergency and commit to exploit the resulting products and services rapidly and broadly at fair and reasonable conditions. This provision applies up to four years after the end of the action.

However, the DMP will specify if different re-use licenses need to be applied to specific data/research outputs upon motivations. The deposited data/research outputs will be made available along with relevant documentation explaining data collection/generation procedures and analysis (e.g., codebooks, methodologies, etc.) and instructions about any tool/software/model that may be necessary for data/research outputs validation, interpretation, and re-use. Moreover, shareable data will be converted from proprietary formats and will made them available in standard documented, and possibly open, formats.

The quality of the data will be carefully assured through:

- Double-checking by members of research teams.
- Quality reviewers checking.
- Regular check for errors, duplicates, or inconsistencies by creating a filter in (.xls) file.
- Applying rules of good scientific practice.
- Excel data cleaning from duplication and empty values.
- Planned system of review procedures by personnel not directly involved in the dataset development process.
- Statistical Analysis.
- Internal and external quality review, assessment, and supervision, also by company legal affairs.

Metadata of deposited data will be open available under a Creative Common Public Domain Dedication (CC 0) or equivalent. Metadata will remain available and findable indefinitely. Metadata will be published and shared among parties on the official repository of Carina projects, on Deliverables and on the official webpage. As far as possible, during the lifespan of the project data will be available on public domain as non-restricted data.

Besides their deposition in trusted repositories, which will grant their re-usability by third parties after the end of the project, data are given full citation from official project publications and web sites.

#### 3. Other research outputs

None at the moment.

#### 4. Allocation of resources

Making data FAIR requires an investment of money and researchers' time. In CARINA case, each partner generating or reusing research data is responsible for their quality, organization, management, and secure storage during the research and for their deposit for publication and preservation according, to the instructions provided in the project. Costs of data collection, quality check, cleaning and conversion to open formats, anonymization, pseudo-anonymization, description and documentation (codebooks, instructions, tools) are included in estimated costs of each partner and UNIBO as coordinator and responsible for the DMP (6 PM) for the whole duration of the project.

During the project, a cloud storage solution (such as OneDrive) will be adopted to share data among partners. The cost to activate and maintain it for the duration of the project will be covered by the project budget. Responsible for data management are the data set creators (see Table 4). Researchers are encouraged to identify themselves with the unique persistent identifier ORCID<sup>9</sup>. Registration is free of charge for researchers and allows for automated linkages between the researched identity and his research activities and outputs.

Keys for "Role" column: Data Collector (such as survey conductors, interviewers...), Producer (person responsible for the form of a media product), Project Member (a researcher indicated in the GA), Researcher (an assistant to one of the authors who helped with research, data collection, processing and analysis but is not part of team indicated in the GA), Research Group (the name of a research institution or group that contributed to the data set).

(See Annex I for details about data management responsibilities related to each project data set).

#### **5. Data security**

At each institution, research data will be stored in computers, laptops, intranets or hard-drives accessible through institutional password periodically modified according to national law provisions for data security and protected by regularly updated antiviruses. None of the project data will be left inadvertently available. All the research materials stored in computers are subject to regular backup in order to safeguard them from accidental losses.

Partner	Data security
IFVNCS	Three back-ups (researcher's computer, USB drive or hard drive, and remote in-house
	approved space)
CCE	Two back-ups: researcher's computer, and remote in-house approved space protected by
	passwords
UNIBO	Encrypted servers of UNIBO
PEDAL	Storage on cloud service (e.g., GDPR); data security controls.
NVMT	Data accessible only with restricted company VPN access.
	Data are archived for at least 10 years. Storage and backup of electronic data during the project
DBFZ	in cooperation with the IT service unit. SharePoint project folder including raw data. DBFZ's
	"Rules of Good Scientific Practice" (DA 3-03, DA=service instruction of DBFZ).
RSB	Internal repository for backup
SAIPOL	Data will be secured and backed-up on Saipol's IT infrastructure
FLANAT	Data will be backed-up on internal server and protected by passwords
ICARDA	Data recovery
INRAT	Storage in back up storage spaces
TI	The tools are linked (Survey & RnDExp) several back-ups are stored on our computer server
AUP	Digital science repository ( <u>http://lib.au-plovdiv.bg:8081/aupsp/</u> ) for long term safe storage of
	the data
NUSEED	Storage in a secured database with regular backups
ARVALIS	Storage in internal institutional servers with back up storage spaces and historical versions
	registration
	In accordance with the 3-2-1 principle and the safe data storage guidelines backup copies of
PULS	research data are made in the OneDrive cloud service in the work Office 365 account

Lable 3.1 Data security measures
----------------------------------

All data will be password protected. If mobile devices are used to store data files (e.g., backup files), they will be kept in a safe place accessible only to the researchers involved or will be encrypted with ad-hoc software. A cloud storage solution (such as One Drive) adopted for data sharing among research teams. In this case, as well, regular backup of the data will be performed to ensure data recovery. In addition, all Partners are asked to keep local updated copies of all their files. Long term preservation of public data is ensured by the chosen data repositories that have specific preservation policies.

All personal data collected within the project from questionnaires, interviewers, surveys, will be carefully protected in compliance with Regulation (UE) 2016/679 - General Data Protection Regulation (GDPR), and following the European Code of Conduct for Research Integrity and the project Ethics Requirements Document.

Data and information collected from questionnaires and interviews will be disseminated and published only in an aggregate and/or anonymous form. Publications report aggregate data or excerpts and will not contain information that may permit the identification of individual participants. Qualitative data files will be published as long as any information that can lead to identification of an individual participant could be deleted.

# 6. Ethics

CARINA project aims to foster the transition towards higher diversified farming systems through a participatory approach engaging farmers and other stakeholders in jointly developing agricultural solutions under specific environmental, technical, and social conditions. The CARINA proposal has been designed to better meet these requirements paying great attention to a participant approach and the active role of lighthouses and living labs in all its work packages and in the collective decision-making processes along the project. The action must be carried out in line with the highest ethical standards and the applicable EU, international and national law on ethical principles.

Regarding the research activities in non-European countries, the ethics standards and guidelines of Horizon Europe will be rigorously applied, regardless of the country in which the research takes place. The Consortium confirms that compliance with ethical principles and applicable international, EU and national law in the implementation of research activities not originally envisaged (or not described in detail) in the DoA will be ensured. The Consortium also confirms that any ethical concerns raised by those activities will be handled following rigorously the recommendations provided in the European Commission Ethics Self-Assessment Guidelines.

The transfer of data on human subjects to the CARINA repository is only considered upon informed consent. All data shall be anonymized. In specific cases and if needed, the affiliation of the participants might be shown to the local multi stakeholder platform, after signing an informed consent of all participants. The Data Owner/Data Provider is responsible for the anonymization or pseudonymization process and for ensuring that identifiable variables are not transferred. Directly identifiable variables include - but are not limited to - name, gender, affiliation, phone number, ZIP-code, e-mail address, gender, address. In this context, the Data Owner/Data Provider shall only provide such variables at the lowest possible resolution that is necessary to for analysis, e.g., region instead of address.

#### **Ethics clearance**

Regarding the use of bio-pesticides within the research activities, reference is made to the ethic clearance validated by the European Commission on 2022.05.31.

#### 7. Other issues

None at the moment.

#### 8. Data set overview

The following table (Tab. 6) offers an overview of the data sets expected from the project which are described in more detail in *Annex I*. It will be updated according to DMP changes and variations.

Table 6 – Data sets list.

Table acronyms and abbreviations:  $n^{\circ}$  = data set progressive number, LB = WP lead beneficiary, PP = project phase (starting month-ending month), CT = creator team in charge of curating the data set, C=collected, G=generated, A=available, IP=in Carina.WP1.Biochemical Analyses Serbia.V1 progress, NYA=not yet available.

### **Annex I: Data set tables**

The analytic descriptions of the expected data sets of CARINA project are reported in this Annex organized by work-packages. For each data set the following elements will be defined:

- dataset name and description including origin (if collected), scale and possible use and impact of the data;
- metadata and standards;
- details on data sharing, open access dissemination and licensing.

In case parts of the data cannot be openly shared, each partner responsible of the dataset generation will provide motivations.

# WP1 – Designing and Implementing Innovative and Sustainable Farming Systems

In WP1 the CARINA farming systems will be implemented in demo fields in 9 EU and associated countries. The new systems will be benchmarked to conventional farming systems as identified by the lighthouses. The likely most suitable carinata genotypes will be supplied by NUSEED to all the partners, depending on growing conditions and cropping scheme, whereas camelina cultivars will be provided by CCE (spring and winter types) and PULS (winter types). The innovative cropping systems co-designed in the local Lighthouses will be evaluated in comparison with conventional local systems (reference) in 9 countries addressing carinata and camelina in 3 cropping systems. In the intercropping systems (co-growth of two or more species together in time and space) the companion food species of carinata and camelina will be identified within the Lighthouses. Food species will be the main crop, while carinata and camelina will be broadcasted thereafter, benefiting from shallow sowing depth. When the food crops have not completely synchronized cycle lengths with carinata or camelina, a relay-cropping system (defined as partial intercropping where the seeding of one crop occurs into another standing crop) will be adopted.

**Objective**: the specific objective is to design and implement new site-specific primary production systems on farm-scale. The new systems will be thoroughly analysed within the lighthouses to co-create and develop innovative and sustainable technical solutions.

Lead: ARVALIS Participants: UNIBO, ARVALIS, AUP, CCE, CRES, ICARDA, IFVNCS, INRAT, NMNT, PULS, SPANISH CO-OPS, TI, NUSEED, FLANAT Months: 1-48

Cont	ents	This dataset refers also to CARINA tasks 1.2 and 1.3. Innovative farming systems will be co- designed with different stakeholders (entrepreneurs, practitioners, academia, decision makers, NGOs) to build up ideas and co-design innovative, diversified and sustainable farming systems including camelina and carinata as cash-cover, inter- or relay cropping in different lands. Specific tools could be used to formalize/analyse the innovative cropping systems (e.g., Systerre). Data will be generated collected through workshops, cross-visits, demonstrations, trials and centralised in an Excel spreadsheet to facilitate data transfer and analysis among partners. Several lighthouses will be organized as a "container" for a systematic user cocreation approach in France, Italy, Spain, Greece, Serbia, Morocco, Poland, Bulgaria and Tunisia including farmers, entrepreneurs, practitioners, academia, decision makers, NGOs, and other stakeholders, to build up ideas and co-design innovative, diversified and sustainable farming systems including camelina and carinata as cash-cover, inter- or relay cropping in fertile or marginal land. Threats, risks, and opportunities from the introduction of these farming systems will be thoroughly analysed using different meeting tools (e.g., quarterly online meetings, mobile apps, dedicated forum on the website (WP6). One workshop (and field visits) a year will be also organised at each experimental site to share results, success factors and technical constraints with local stakeholders. Feedbacks from T1.2 to T1.4 will also help improve farming systems.
Data	format	Numerical, digitized, quantitative, derived, excel (.xls, xlsx, .csv)

Cont	ents	This dataset will concern camelina on-farm trial data from Morocco. Several lighthouses will be organized as a "container" for a systematic user cocreation approach in France, Italy, Spain, Greece, Serbia, Morocco, Poland, Bulgaria, and Tunisia including farmers, entrepreneurs, practitioners, academia, decision makers, NGOs, and other stakeholders, to build up ideas and co-design innovative, diversified and sustainable farming systems including camelina and carinata as cash-cover, inter- or relay cropping in fertile or marginal land. Threats, risks, and opportunities from the introduction of these farming systems will be thoroughly analysed using different meeting tools (e.g., quarterly online meetings, mobile apps, dedicated forum on the website (WP6). Lighthouse experiences from previous projects and success stories will be

	shared to streamline the decision process. Locally widely adopted farming systems will be used
	to benchmarking. One workshop (and field visits) a year will be also organised at each
	experimental site to share results, success factors and technical constraints with local
	stakeholders. Feedbacks from T1.2 to T1.4 will also help improve farming systems. Results
	from T1.1 will be included in D1.1 and D1.2
Data format	Quantitative, qualitative (.xls/.xlsx), raw, secondary, derived, cleaned, processed (.csv, .rtf,
Data Iol Illat	.txt).
Data volume	Final volume of data is expected to be 100 GB
	Metadata will be made available under a CC0 license, while data acquired in the project
Accessibility	will be made available under a CC BY license to allow access to the data in accordance
	with FAIR principles.

Contents	All dataset for the lighthouses is in direct correlation the field trials in Task 1.2, 1.3 and 1.4. The lighthouses for co-design of new farming system will be organized and the results of the discussion and decisions will be published. The information is with open access to all scientists, experts and farmers that could be interested in cover cropping. The data will be generated after establishment of real field trials with the corresponding cropping system and the successful management at least for one year. The successful practice will be presented to a large audience of farmers, experts and scientists. Further projects on optimization of the variety structure, according to the stress conditions, implementation of the end products and balanced contributing to the circular economy of the region are expected.
Data format	Qualitative, text, images, video, quantitative
Data volume	Final volume of data is expected to be 10 GB
Accessibility	The metadata can be shared in the project cloud and in the digital science repository or electronic catalogue of AUP after the end of the project. Where possible data will be shared with a CC BY license

Contents		Basic agronomic and phenotypic information will be collected (Task $1.1 - 1.2 - 1.3$ and Task 1.4). This will include parameters i.e., soil type, precipitation, crop phenology, disease and insect pressure, grain yield, potential weather-related events like frost, temperature etc., seed quality and fertility inputs. Data will be collected either onsite in Serbia or remotely with other partners and will generally be compiled at the end of each crop cycle. Data collected in this work package is the fundamental for the success of Carinata aspect of the project. We will determine which area cultivating the crop will be best adapted. Data generated will be used for commercialization of the product in EU partner countries.
Data format		Quantitative and qualitative data (.xls/.xlsx); digital images (.jpeg, .png)
Data volume		Final volume of data is expected to be 1 GB
Accessibility		Data will be available and shared through public repository through an Open license data (TBD).

Contact Person/s Contents		This data set will contain information on biochemical analyses of up to 1000 samples of plant material carried out in a laboratory. The analyses include contents of total oil, total proteins, pigments, starch and antioxidant tests. The results of these analyses include gravimetric (mass is measured on a scale), volumetric (volume is measured using volumetric vessels), spectrophotometric (absorbance of the solution is measured) and polarimetric (optical rotation of the solution is measured) measurements. The generated data will support conclusions on crop performance and quality of plant material aiming at improved primary production and may be useful to farmers. Biljana Kiprovski and Milica Kantardžić will generate and collect data from measurements. Both are responsible for calculations and processing of data. Data will be entered manually into Sample Receipt Book (F05.10.02) and Workbook (F05.10.03) and then digitized into tabular or textual files. PerkinElmer LAMBDA™ UV/Vis will generate data on spectrophotometry for the determination of pigment content and antioxidant tests. A wider research community can benefit from the data on biochemical analyses of the crops. Data could be used by farmers to adopt the best cultivation practices for crops used in the project. This dataset refers also to CARINA Task 1.3 and 2.5 (Demonstration of circularity).

Results from this task will be included in D1.3 and D1.4. Task 1.4: Abandoned land has been alarmingly increasing across Europe over the last decades mainly due to changing climatic conditions and commodities price. Camelina and carinata are broadly recognized as very resilient crops, requiring limited agronomic inputs for their cultivation, thus making them sound candidates for marginal/abandoned land. Both will be investigated under marginal conditions (e.g., water scarcity and low fertility) in demo fields (> 0.5 ha) in 5 EU and 2 Africa countries (see table below). Camelina and carinata will be grown as alternative to fallow land.

Contents	Results of large field trials of cover cropping system in marginal areas with camelina and carinata will be presented. Information about vegetation and harvest results, along with some risks and problems during the experimental years, will be presented. Possible uses and further development will be discussed with all stakeholders. The information will be useful for farmers, experts, scientists, and others. The data will be generated after establishment of real field trials with the corresponding cover cropping system for marginal areas and the successful management at least for one year. All dataset for Task 1.4 is in direct correlation the field trials in Task 1.2 and 1.3 as well as the lighthouses in Task 1.1.

Contents		This dataset will regard field information gathered in three seasons growing B. Carinata and other re-used and new data from Literature/EU Projects review and interaction with stakeholders. Abandoned land has been alarmingly increasing across Europe over the last decades mainly due to changing climatic conditions and commodities price. Camelina and carinata are broadly recognized as very resilient crops, requiring limited agronomic inputs for their cultivation, thus making them sound candidates for marginal/abandoned land. Both will be investigated under marginal conditions (e.g., water scarcity and low fertility) in demo fields (> 0.5 ha) in 5 EU and 2 Africa countries (see table below). Camelina and carinata will be grown as alternative to fallow land.
Data f	ormat	Qualitative information, data collection/generation (raw data) data processing data preservation and sharing (.csv)

# WP2 – Full Biomass Valorisation with a Circular Economy Approach

The full valorisation of the carinata and camelina feedstocks sourced from WP1, (i.e., oil, meal and coproducts derived from camelina and carinata), will be the focus of WP2. The oxidative cleavage of the oil will be applied and optimized by NVMT to convert erucic acid of carinata into brassilic and pelargonic acid from which obtaining several biodegradable products (brassilic acid) such as mulch films, pots, clips, and pheromone supports. Brassilic acid will be also tested for the synthesis of new biopolymers. Pelargonic acid will be evaluated for the formulation of biodegradable bioherbicides to be applied in WP1 on camelina and carinata thus closing the loop. Different antinutritional compounds (glucosinolates (GLS) from carinata and polysaccharides (mucilage/gum) from camelina) reduce the possible palatability and inclusion rate of the two crops in different livestock meals.

**Objective**: the specific objective of this WP is to valorise the co-products of carinata and camelina through the extraction of molecules having different applications in the field of bioplastics, biochemicals, animal nutrition, biofuels, biostimulants and/or biopesticides.

Lead: **KIMITEC** 

Participants: PULS, SAIPOL, TI, CCE, NUSEED, NVMT, FLANAT, TI, IFVNCS

Contents		The goal of this Task is to find the optimal incorporation rate of camelina and carinata cake in meals. Moreover, meals will be evaluated in term of responses of livestock species. In collaboration with Mix-science (Avril group formulator), SAIPOL will carry out palatability tests of camelina- and carinata-based meals on cattle, poultry, pork (in vivo). Mix-science will perform in-vitro test and analyse dry matter and protein degradability and digestibility. Carinata and camelina cakes are interesting animal feeds due to their high protein content. Glucosinolates and other antinutritional compounds (e.g., polysaccharides) can however negatively impact the digestibility and palatability of the meal. The goal of this task is to find the optimal incorporation rate of camelina and carinata cake (2% to 20%) in meals.

# WP3 – Integrated Sustainability Assessment of the new Bio-Based Carina Systems

To consider the complexity of modern agri-food systems and the possible impacts on the society, the social performances and risks of the novel CARINA systems will be measured and quantified in WP3. To this purpose, a life cycle approach will be adopted to evaluate social impacts by adopting a systematic framework that complements the environmental Life Cycle Assessment and allows to identify hotspots and trade-offs11,12. Social Life Cycle Assessment (SLCA) is a methodology to assess social impacts of a product or a service over its entire life cycle (from raw material extraction to the disposal phase) considering up to five main categories of stakeholders (workers, local community, society, consumers, value chain actors), as stated by the UNEP-SETAC Guidelines 2020. According to this methodology social performances and risks can be assessed using a reference scale approach (UNEP, 2020) allowing to evaluate impact categories through reference points to be scored and aggerated for each assessed stakeholder13. Part of the economic and environmental assessment will be run using SYSTERRE®, which is a multi-criteria assessment tool accessible on a webserver with secure access.

**Objective**: the specific objective is to carry out an integrated sustainability assessment of CARINA bio-based production systems, including the identification of sustainability indicators for the assessment of the economic, social and environmental impacts.

Lead: DBFZ

Contents		A long list of possible sustainability indicators in the context of economic, social, environment and integration. The long list of indicators will be tested bottom up (3.1.2) and final sustainability indicators will be selected, and later on applied to the selected CARIAN concepts. Expert discussion and brainstorming of relevant parameters for literature review. For this step a basic recommendation was provided by DBFZ. This was discussed and completed with further WP partners. Identification of main parameters. The main parameters identified year range, relevance of the document, language, includes sustainability, includes bioeconomy, contains indicators. Literature review: DBFZ provided a first core collection of possibly relevant documents and made available for all WP partners. The list was completed via WP partners and other project partners, based on their own expertise. Results will be used directly in 3.1.2 for bottom-up review.

Contents		This dataset will provide a final list of indicators developed in T3.1, to analyse how the sustainability advantages of the developed alternatives can be validated through those indicators. These indicators will be discussed and prioritized within a Workshop on living labs (WP5). The 3.1.2 Sub-Task will test with partners of WP1 the set of indicators developed in T3.1, to analyse how the sustainability advantages of the developed alternatives can be validated through those indicators (e.g., high environmental suitability, use unproductive land, promote biodiversity, diversify farm income, valorise co-products; or synergy indicators, e.g., production of multiple feedstocks, suitability to existing farm

	facilities). These indicators will be discussed and prioritized within a Workshop of living
	labs (WP5). Results from this sub-task will be included in D3.1

Contact Person/s Contents		This dataset refers to CARINA Task 3.2, 3.3, 3.4, 3.5 and to the Sub-Task 3.1.4. Based on the description of agricultural practices and strategy, SYSTERRE calculates and generates a set of indicators to assess the technical, economic and environmental performance of productions and then, to build innovative alternatives in terms of sustainability. SYSTERRE® uses scientifically recognised standardised methods to calculate a panel of 20 indicators. These indicators can be classified in 3 categories: technical indicators such as working time and number of tool passes, fuel consumption, etc., economic indicators such as economic efficiency of inputs, mechanisation costs, margins, production costs, etc., and input use and environmental indicators such as overall nitrogen balance and mineral balance, TFI (treatment frequency index), energy production and consumption, greenhouse gas emissions, etc. This strategic decision support tool can be used for farm advisory services, student training, as well as experimenting with cropping systems. SYSTERRE® is a tool used to describe practices and calculate a set of indicators designed to assess the technical, economic and environmental performance of cropping systems. The crop management of the different CARINA concepts and the reference one identified in T1.1 will be registered with Systerre tool. The crop management will be described for all crop rotations to consider the impact of opportunities on the previous or the following crop. Data will be extracted and linked to the tools used in T3.2, T3.3 and T3.4. Systerre tool, its database and calculation program could be improved depending on the indicators identified in T3.1.

	This dataset will include a list of about 10 synergic/integration indicators, which will be quantified
	for the selected CARINA concepts. To quantify synergic indicators identified in 3.1, which
	cannot be quantified from T3.2-3.4, a questionnaire will be prepared and provided to WP1 and
	WP2 leaders, to be estimated/calculated for each CARINA concepts. Results from this task will
	be included in D3.5. Data will come from WP1 (for the biomass/production/farm level) and from
Contents	WP2 (for the use of the biomass). Besides, a Workshop is planned. Indicators will be relevant,
	when presenting the overall results of the selected concepts. This information belongs to the full
	information about the concepts. It will be presented in D 3.5. For synergic/Integration Indicators
	which cannot be quantified within WP2-WP4, a questionnaire will be prepared for all concepts,
	and will be provided to WP1 and WP2 leads, to respond them and quantify the indicators. If a
	quantification is not possible, and estimation or qualitative description will be provided.

# WP4 – Co-creation of policy interventions for feedstock provision and certification in carina bio-based value chains

In WP4, the quintuple innovation helix framework, the collaboration with the Lighthouses in WP1 (farmers and farmers' cooperatives, etc.), and all stakeholders from the national Living labs in WP5 (including government, industry, NGOs, certification schemes and academia) will take place. The work will cover all related policy sectors (agriculture, environment, energy, circular bioeconomy, rural development, etc.) but will have specific focus on how the primary production systems in WP1 can be supported within the carbon farming initiatives and what tailored interventions (regulations, financing, etc.) can facilitate this. The specific objective is the following: to design and implement new site-specific primary production systems on farm-scale. The new systems will be thoroughly analysed within the lighthouses to co-create and develop innovative and sustainable technical solutions. CARINA will apply the quintuple innovation helix framework16 to understand the policy interventions needed to support at EU/national and regional level the new diversified farming systems, and also to identity the gaps present in the actual certification schemes. The stakeholder categories forming the 5 main components of the quintuple helix will be tailored to also relate to advisory services in European Agricultural Knowledge and Innovation Systems17 (AKIS) within the participating countries and Europe.

**Objective**: the specific objective is to co-create a set of policy recommendations that can maximise economic, environmental and social synergies in the provision of certified low iLUC feedstock for bio-based value chains.

#### Lead: UNIBO

Contributor/s Contact Person/s Contents		This dataset will provide a final list of policy instruments cocreated through policy innovation labs carried out in LLs of WP5 with relevant stakeholders. The work in this task will build on Task 4.1 results and the farming systems in WP1, discuss stakeholders' needs and challenges they face with current policy approaches and their implementation (incl. administrational burdens, etc.). and propose tailored interventions promoting sustainable agricultural production systems in full respect of biodiversity protection and enhancement objectives. The work will consider the diversity and diversification of farming systems in the countries involved in WP1 activities and at EU level and co-define, jointly with stakeholders in the policy innovation labs the policy relevant challenges and gaps that restrict supplying sustainable biomass, securing stable revenues for farmers, lowering environmental negative impacts, and increasing resilience to climatic, economic and biological risks. The policy innovation lab is a bottom-up approach that aims to create a reflexive space where stakeholder contributions and co-creation activities are the most important stages of the policy development. Depending on stakeholder availability and Covid restrictions the interactions will take place both as a real physical space and/or a series of online meetings with stakeholder approach (policy-makers, scientists, local community representatives, farmers, farmer cooperatives, supply chain actors and NGOs) envisages that the policy and innovation needs and requirements are formatted and refined into policy and innovation lab will be created in each participating country (Italy, France, Spain, Germany, Bulgaria, Serbia, Poland, Tunisia, Greece and Morocco). Results from this task will be included in D4.3.

# WP5 – Social Innovation to Scale-Up Carina Solutions for Bio-Based Agricultural Production Systems

Social innovation is increasingly attracting scholarly attention and is one of the European Union's innovation policies initiatives and it will be the focus of WP5. It is distinct from other innovation strategies because it moves beyond the focus on enterprise-driven technical innovation to include other sectors, such as health, social services, and education. It adds a social dimension to innovation by including social-ecological innovation and economic revival for remote rural areas. Moving to circular, low carbon bioeconomy requires a systemic shift in the way raw materials are sourced, and the way businesses and industries interact with their suppliers and customers and convey clear messages about the circularity and biobased origin of their products. CARINA will improve understanding of the co-benefits and potential risks and deliver solutions for upscaling potential bio-based agricultural production systems through a social innovation process: i) to work with national teams in the LLs including national networks of primary producers and boards of market agents; ii) to 'co-define challenges' and co-create future solutions and learn from innovators, and iii) to implement the solutions locally and deliver tailored roadmaps and business plans.

**Objective:** the specific objective is to improve understanding of the co-benefits and potential risks, and to deliver solutions for upscaling potential bio-based agricultural production systems through a social innovation process. To achieve this objective, CARINA will establish national living labs (LLs) and organise 'co-define challenge' workshops within technical field visits, with the aim to cocreate solutions from lessons learned, and to implement them locally to deliver tailored roadmaps and business plans.

#### Lead: SPANISH CO-OPS

Participants: ALL

Months: 1-46

1	NYA	Work package WP5: Social Innovation to scale-up CARINA solutions for bio-based agricultural production systems – Task 5.1: Integrating concurrent research and innovation processes within a public-private-people partnership operating in specific contexts: Living Labs. Task 5.2: Knowledge transfer at local level to co-define challenges with primary producers for the future scale-up of CARINA systems. Task 5.3: Co-define challenges and co-create social innovation solutions. CARINA.WP5.Stakeholders feedback. V1.

Conta	ct Person/s	Sagarna, Juan (Co-ops sagarna@agro-alimentarias.coop)
Contact Person/s Contents		The organisation of national Living Labs (LLs) in France, Italy and Spain, where the CARINA bio- based systems will be developed through a participatory approach. LLs will involve farmers, cooperatives, agronomic advisers, policy makers, farmer unions, academia, and other related experts to co-define challenges, explore emerging uses, and look for market opportunities. Task 5.2: Knowledge transfer of CARINA's results will greatly benefit from the massive and well- established relationships with farmers and cooperatives by Spanish Co-ops, ARVALIS, CCE, TI, NVMT, IFVNCS. It should be recognized that Spanish Co-ops represents more than 1 million farmers in Spain, TI has over 200.000 oil crop growers and f livestock farmers, ARVALIS is directly funded by farmers of which about 1.000 farmers are currently carrying out demo trials; NVMT has recently founded a new company (MaterAgro with Coldiretti that is the major organisation representing agricultural entrepreneurs at European level including about 1.5 million farmers; CCE operates in Spain directly cooperating with more than 500 farmers; finally, IFVNCS has a solid connection with more than 1.000 farmers. Results from this task will be included in D5.2. Task 5.3: First, the core team (DBFZ, Spanish Co-ops, UNIBO) will go through an exploring process to better understand the current challenges and be able to define and draw up a clear, engaging and positive challenge questions that would be brought to the co-define workshops with the LL set up in Task 5.1. This process will include literature review and interviews to know more about the challenge, engage key stakeholders – including potential funders of the upcoming solutions - and end users in the process, look at other innovative solutions to similar challenges in other places, and to understand end users' perspectives. Following, a series of 'local challenges workshops' will be organised in combination with the knowledge transfer activities in T5.2 in order to further tailor the overall challenges and co-create

### WP6 – Dissemination, Communication and Exploitation

**DISSEMINATION ACTIVITIES.** Dissemination is a key factor for engaging relevant stakeholders in CARINA in order to elaborate exploitation routes and ensure that the project results will be exploited by the identified stakeholders at the end of the project. Therefore, all consortium partners will actively conduct dissemination activities, under the guidance and monitoring of PEDAL in WP6. The PEDC will be ready by M6 and thereafter the Dissemination activities will begin once the first results of the project emerge (M7 - M48).

**COMMUNICATION ACTIVITIES.** A strong and efficient **communication** strategy will be developed by PEDAL with the support of all partners. CARINA's communication strategy aims to provide project related information to multiple audiences – farmers, biobased industry, academia, policy makers, the media and the public. To achieve this goal, strong and efficient communication measures and activities targeted to different group of stakeholders will start from M1. A brief summary of the preliminary communication plan is provided below, including the main activities and channels (HOW), target groups (WHO), and target value (HOW MUCH). During the project, the progress of the communication activities will be monitored and adjusted if necessary. The communication activities will start in M1 and will be spread until M48 when the project will come to an end. The performed communications activities will be reported in M6, M24, and M48.

**EXPLOITATION ACTIVIES**. The knowledge and data created during CARINA will be useful in research, technological innovation, policy and business areas, therefore, this strategy will be designed keeping in mind the interest of the different partners. The priority is sharing results, processes, policies and tools and their underlying data as openly as possible (see 1.2.5), nevertheless, careful considerations over background IP will avoid any potential infringement of the IP of CARINA partners. The results of CARINA such as the carinata and camelina seed full characterizations, the CARINA factsheets about local challenges and executive summary of field visits, Policy Recommendations, Compilation of the national roadmap and business reports will be open, including the underlying data. All stakeholders will have access to the projects results free of charge via the CARINA website and their availability will be broadcasted by communication and dissemination activities. The Project's results (ones not subject to background IP) will be made available to the interested users. A thorough exploitation plan will be drafted in WP6 led by our partners PEDAL with the contribution of all partners during the project. However, some of the partners have already indicated their exploitation interest. PEDAL will use the projects results to improve on its service portfolio to support its clients better. In the table below,

we give a summary of the exploitable outcomes from this project. The exploitation activities will take place between M4 - M48 and will be reported on in M24 and M48.

**Objective**: the specific objective is to ensure wide visibility of CARINA by setting up an effective communication dissemination strategy and, at the same time, pave the way for the exploitation of the CARINA results. CARINA will achieve this objective posing attention to cluster and create synergies with other EU initiatives with strong links with CARINA.

Contents		A subscription form hosted in the project's web site will aid the collection of these data in which any interested stakeholder can freely provide their contact details in a dedicated sign- up form so as to receive the most up-to-date news and outcomes of the project. A newsletter will be sent to subscribers once per 6 months. With that in mind, these data will be collected so as interested stakeholders can be informed about CARINA's progress and upcoming events. The data will be comprised of a list of subscribers along with their personal information such as: (i) email address, (ii) first and last name, (iii) country, (iv) type of organization, (v) region and (vi) gender. A copy of this contact list will be stored to Icontact, which is used for e-mail campaigns and newsletters distribution. All personal information

	included in this contact list will be used and protected according to provider's Privacy Policy. Subscribers can find details about how their personal information are managed on the
	respective privacy policy section of the CARINA website.
Data format	Numerical and textual, born digital quantitative and qualitative. (.xlsx).
Data volume	Final volume of data is expected to be 1 MB
Accessibility	Metadata will be made available under a CC0 license, while data acquired in the project will be made available under a CC BY license to allow access to the data in accordance with FAIR principles.

Contents		These data will be collected during the implementation of the project through: (i) the different events (e.g. workshop, conferences, interviews, physical and virtual events, etc.) organized by CARINA (either alone or jointly with other projects or initiatives) consisting of the participants lists that will enclose demographic information about the participants; and (ii) the participation of CARINA partners in relevant third party events in order to reach out and engage stakeholders, thus collecting general information about the events attended and their outreach. Along these lines, these data will be collected so as to keep track of the results of activities in events for stakeholder engagement and provide the opportunity to project partners to report on these activities. Moreover, these data will be updated every time a partner attends an event, or a partner organizes an event.
Data format		Quantitative, qualitative stored in a standard spreadsheet (.xlsx, .png, .pdf, .docx).
Data volume		Final volume of data is expected to be 500 KB
Accessibility		Data will be available and shared through public repository through an Open license data (TBD).

#### WP7 – Coordination & Management

The coordination and management structure of the project is composed by the following bodies, of which specific tasks and procedures will be described in the Consortium Agreement (CA) adopted by the consortium before the project starts: a) the Coordinator, Andrea Monti (UNIBO), will be ultimately responsible for the overall project coordination and act as intermediary between the Consortium and the EC; b) The General Assembly, comprised of one member from each partner institution, will be the steering and decision-making body; d) Work Package Leaders, in charge of supervising the activities carried out in the respective WPs, will be the executive body; e) The Project Manager will be appointed within the European Program and Project Office of UNIBO. They will assist the General Assembly and the Coordinator in all administrative and financial duties; f) The Communication, Dissemination and Exploitation Manager (PEDAL), will assist the Coordinator and the WP Leader in the communication, dissemination, and exploitation activities; g) The Stakeholder Advisory Board, external body comprised of relevant public and private stakeholders, will provide feedback and advice as required.

**Objective**: the specific objective is to coordinate and supervise the project activities, ensuring quality and timing of project deliverables; (2) to carry out administrative and financial management, and reporting; (3) to manage contacts with the EU Commission (EC); (4) to resolve possible conflicts; (5) to oversee the knowledge and innovation management activities; (6) to manage the data generated by the project (Data Management Plan - DMP)

Lead: UNIBO

Participants: ALL Months: 1-48

No dataset is expected at the moment.
